## Lesson 1.1: How are your favorite classes related?

Is your favorite elective class associated with your favorite core class? Collect class data to see if there is a relationship.

- Which of the following is your favorite elective class? You must choose only one and mark your choice on the board.

Art	Music	Physical Education	Foreign Language	Technology

- Identify the individuals and variable?
- Is the variable categorical or quantitative?
- Go to [stapplet.com](http://stapplet.com) to enter the class data. Make a bar graph and a pie chart. Sketch them below.

- Sometimes it is helpful to investigate more than one variable. Come to the board and put a tally mark where you belong.

**Find each of the following:**

		Core Class		% of all students who chose P.E.:
		Math	English	
Elective	Art			% of all students who chose Math and chose Art:
	Music			
	P.E.			% of the students who prefer math that chose Tech.
	Foreign Lang.			
	Tech.

6. How many variables does the table have? Are the variables categorical or quantitative?
7. Which variable would best explain or predict the other variable?
8. Go to [stapplet.com](http://stapplet.com) and enter the data. Make a side-by-side bar graph and a segmented bar graph. Sketch them below.
9. How do the bars in the side-by-side-bar graph relate to the bars in the segmented bar graph?
10. Is there an association between favorite core subject and favorite elective? If so, describe it.
11. If there was not an association between favorite core subject and favorite elective, what would the graphs look like? Explain.

## Lesson 1.1 – Analyzing Categorical Data

Important Ideas:

### Check Your Understanding:

1. Students at a local high school were asked which gaming system they preferred: the Playstation 3, the Xbox 360 or neither. The graph shown at right shows the results. Explain why the graph may be misleading.

2. An article in the Journal of the American Medical Association reports the results of a study designed to see if the herb St. John's wort is effective in treating moderately severe cases of depression. The study involved 338 patients who were being treated for major depression. The subjects were randomly assigned to receive one of three treatments: St. John's wort, Zoloft (a prescription drug), or placebo (an inactive treatment) for an 8-week period. The two way table summarizes the data from the experiment.

- a. What proportion of subjects in the study were randomly assigned to take St. John's wort? Explain why this value makes sense.

		Treatment		
		St. John's wort	Zoloft	Placebo
Change in depression	Full response	27	27	37
	Partial response	16	26	13
	No response	70	56	66

- b. Find the distribution of change in depression for the subjects in this study using relative frequencies.

- c. What percent of subjects took Zoloft and showed a full response?
